

## Reader's Response: Face-to-face or face-to-screen?

The article discusses the difference between online and face-to-face higher education. It points out that although online education is flexible, students prefer face-to-face interaction for more engagement, especially in discussions. The article posits that both methods are useful, but student experience and preference must be taken into account. With the increasing importance of digital education, the article calls for more research to improve both online and conventional learning environments.

This review offers useful insights into the controversy of virtual learning vs. face-to-face learning. I enjoy the balanced approach, recognizing the advantages of both modes. From my own experience, although online learning is convenient, it tends to lack the immediacy and interactive buzz of classroom debate. The focus on student experience is important, reminding teachers that education is not merely about content but also creating a rich and nurturing learning environment. Thus, the appeal to conduct further research is acutely pertinent since evidence-based strategies are necessary to inform future education in the rapidly growing digital era. In the end, the most important thing to note is that an integrated method—blending online and traditional learning—may be the best solution to support varying student needs and build the most effective learning environments.
